TITLE: Production and analysis of gallium arsenide films

SOURCE: Ref. zh. Elektronika i yeye primeneniye, Abs. 1B106

REF SOURCE: Sb. Poverkhnostn. i kontaktn. yavleniya v poluprovodnikakh. Tomsk,  
Tomskiy un-t, 1964, 422-431TOPIC TAGS: gallium arsenide, semiconducting film, polycrystalline film, Hall effect,  
thermoelectric phenomenon, thermal emfTRANSLATION: Gallium arsenide films with Se and Zn impurities were obtained using  
thermal precipitation and chemical reaction (in the presence of iodine) in a quartz  
container. The use of iodine facilitated the deposition of film at a rate of 50 to 100  
μ per hr. The investigation of temperature dependence of the Hall effect coefficient,  
and the thermal emf coefficient over the 0-180°C interval, showed that the concentra-  
tion of the electric charge carriers does not vary over this temperature range; the  
electric conductivity does increase, however, due to the intercrystalline layers. The  
thermal emf coefficient increases logarithmically. An investigation of film isotropy  
over its thickness and the distribution of impurities was carried out. A. P.

many years under the direction and direct participation of the authors. The water-power evaluation includes detailed characteristics of 2,174 rivers of the republic (over 10-km long), water-power potential of which is estimated to be 172.6 billion kw-hr a year. Information is given for six separate regions: southern, southeastern, eastern, northern, central, and western. The tables include data on the length of rivers, flow gradient, watershed areas, and power resources. The book is intended for workers of scientific research organizations and industrial enterprises, dealing with the planning and development of water management installations and systems in the republic. Numerous tables and charts are included.

TITLE: Effect of thermomechanical treatment of steel by extrusion  
on mechanical properties

SOURCE: Metallovedeniye i termicheskaya obrabotka metallov, no. 8,  
1964, 16-21, and insert facing p. 41

TOPIC TAGS: thermomechanical treatment, steel thermomechanical  
treatment, high temperature thermomechanical treatment, low tempera-  
ture thermomechanical treatment, ausforming, extrusion ausforming

ABSTRACT: Specimens of 40KhNMA steel (0.34% C, 0.72% Cr, 1.41% Ni  
and 0.25% Mo), 18 mm in diameter and 60 mm long, were subjected to  
high- and low-temperature thermomechanical treatments (HTTMT and  
LTMT) by extrusion in order to determine the effect of HTTMT and  
LTMT conditions on mechanical properties. The specimens were aus-  
tenitized at 950°C for 30 min, cooled to 850°C (HTTMT) or 550°C (LTMT),

Cord 1/3

L 15760-65  
ACCESSION NR: AP4044134

and extruded with reductions of 30-80%, or cooled to 850-300C and extruded with a reduction of 700%. All the extruded specimens were oil quenched immediately after extrusion. The extrusion was performed at a rate of 150 mm/sec in a 200-ton hydraulic press at a specific pressure of 9.1-11.0 tons/cm<sup>2</sup> at 850C and 24.0 tons/cm<sup>2</sup> at 550C. The best combination of mechanical properties was produced by extrusion at 850 or 550C with a reduction of 50--80% followed by oil quenching and tempering at 100C. Specimens extruded at 850C with a reduction of 80% had a tensile strength of 215 kg/mm<sup>2</sup>, yield strength of 170 kg/mm<sup>2</sup>, elongation of 11.5%, reduction of area of 52.0%, and notch toughness of 6.5 mkg/cm<sup>2</sup>. Corresponding values for specimens extruded at 550C were 238 kg/mm<sup>2</sup>, 185 kg/mm<sup>2</sup>, 10.8%, 42.0%, and 8.1 mkg/cm<sup>2</sup>, and for conventionally heat treated specimens, 200 kg/mm<sup>2</sup>, 160 kg/mm<sup>2</sup>, 9%, 30%, and 5.3 mkg/cm<sup>2</sup>. The best strength characteristics were attained with extrusion at 550-850C and the best ductility characteristics, with extrusion at 700-850C. Increase of reductions over 30% was accompanied by an increase in ductility without strength drop. High reductions at 850C produced a recrystallization which had no detrimental effect on the strength. Orig. art. has: 6 figures.

TITLE: On the formulation of several incorrect problems of mathematical physics

SOURCE: Sibirskiy matematicheskiy zhurnal, v. 7, no. 3, 1966, 559-576

TOPIC TAGS: integral equation, boundary value problem, Cauchy problem, Laplace equation, partial differential equation

ABSTRACT: The solution of the general equation

$$A\phi = f. \quad (1)$$

is said to be correctly formulated if there exists a function  $B(f)$  defined and continuous in all  $F$  and inverse to the function  $A(\phi)$ , where  $F$  is a total metric space and  $A\phi$  is a function with a region of definition  $\Phi' \subseteq \Phi$ . Approaches to incorrect problems are set forth using the classical Cauchy problem for Laplace's equation as an example. The first approach involves altering the notion of correctness. Tikhonov's method, for example, defines for (1) a closed set  $M \subseteq \Phi$  and proceeds from the rules: 1) it is known *a priori* that a solution  $\phi$  exists for some class of data and belongs to  $M$ ; 2) the solution is unique in the class of functions belonging to  $M$ ; 3) corresponding to

UDC: 517.944

Card 1/2

L 03018-67

ACC NR: AP6028218

infinitely small changes in  $f$  which do not carry  $\phi$  outside of  $M$  are infinitely small variations in the solution. Another method is to retain the notion of correctness according to Hadamard, but to change the definition of a solution. A more general method is also described. A probabilistic approach is given in detail and illustrated in the solution of linear integral equations of the first order convolution type. Orig. art. has: 95 formulas.

Title : On the Question Concerning the Sensory Innervation of Muscles  
of the Tongue of a Dog.

Orig Pub : Byul. Mosk. o-va ispyt. prirody, Otd. biol., 1957, 62, No 2,  
105-106

Abstract : The plica (L) of the tongue (spindle-like formation which extends from the tip to the frenulum) possesses a compound motor and sensitive innervation. The motor nerve fibers penetrate under the capsule together with the vessels and form motor end-plates. The sensory terminals of L are subdivided into: sensory branches of different degree of complexity are met in great quantity, they form a continuous receptor field in the capsule; fine short-ramifying branches which lie in the location of the special muscle attachment

Card : 1/2

USSR/Human and Animal Morphology (Normal and Pathological) Nervous S  
System.

Abs Jour : Ref Zhur - Biol., No 7, 1958, No 31203

point of the tongue to the capsule of L; end-bulbs of the  
Kreuse type in the capsule and in the surrounding tissues.  
By the method of transection, it was established that the  
sensory innervation of L is accomplished by the lingual nerves,  
while the motor innervation is accomplished by sublingual  
nerves. The glossopharyngeal nerve plays an insignificant  
part in the innervation. Clearly L cannot be studied only  
as a motor formation, but its receptor function must also be  
taken into account.

TITLE: The Accelerated Analysis of Mixtures Containing Ammonia and  
Methylamine (Uskorennyy analiz smesey, soderzhashchikh amniak i  
metilaminy)

PERIODICAL: Zavodskaya Laboratoriay, 1958, Vol. 24, Nr 3, pp. 283-287 (USSR)

ABSTRACT: A method of determination was worked out which was developed from three different methods. One of them is the chromatographic analysis according to Fuks and Rappoport Ref. 37. From a hydrochloric acid solution three samples are taken. In the first sample dimethylamine is determined polarographically or by dydrazine-method. In the second sample the hydrochlorides of ammonia and methylamine are treated with butanol and chloroform. The third sample serves for the chromatographic determination of trimethylamine. Should the solution contain less than 0.25 g/l ammonia, determination of ammonium chloride cannot be carried out with butanol but according to Leon Ref. 2, by a precipitation with

Card 1/2

The Accelerated Analysis of Mixtures Containing Ammonia and Methylamine

32-3-12/52

sodium cobaltinitrite. The extraction of trimethylamine in chromatographic determination is carried out, instead of with butanol, with benzene according to Gerber and Hildi /Ref.97/. as in this way a better separation is attained. Chromatographic determination was carried out in a mixture of starch and calcium oxide with bromothymol blue. titration is carried out with a 0.02-0.05n sulphuric acid solution. The accuracy attained satisfied the demands made by industry and analysis is said to take three hours. There are 2 tables, and 9 references, 5 of which are Slavic.

Title : Sorption of Streptomycin by Carboxyphenol Resins

Orig Pub: Antibiotiki, 1956, 1, No 5, 42-46

Abstract: Trivalent cathions of streptomycin ( $\text{Str}^{3+}$ ) are sorbed irreversibly at sulfocathionites while with purely carboxylic cathionites (KFU and KMT) absorption capacity for  $\text{Str}^{3+}$  amounts to only 38-22% of their capacity for simple inorganic cathions ( $\text{Na}^+$  and  $\text{Ca}^{2+}$ ), evidently due to steric hindrances caused by excessively close distribution of carboxyl groups. It was found, in accord with the theoretical assumption, that the readily swelling, capable of ion-exchange

throughout their bulk, resins of the mixed carboxy-phenol type (KRFFU, KRFU, Czechoslovak ROA resin), of strongly reduced general exchange capacity (phenolic OH groups do not participate in the exchange), exhibit considerably greater relative adsorption capacity for  $\text{Str}^{3+}$ . It is shown that the constant of  $\text{Str}^{3+}-\text{Na}^+$  exchange at carboxy-phenolic resins differs little from the constants at purely carboxylic resins.

TITLE: The Polarization-Optical Method for Investigating Tensions in Seal-  
ing Parts

PERIODICAL: Kauchuk i Rezina, 1960, No. 3, pp. 37 - 40

TEXT: The distribution of stress in rubber sealing parts was studied by experiment. If the magnitude and distribution of the stress is known, new parts can be designed on a scientific basis and the existing models can be investigated. The applied polarization-optical method helps to investigate the stress distribution and magnitude depending on the size and shape of the part. References 3, 4 and 5 give details of this method. It is based on the fact that most transparent isotropic materials acquire under stress the property of double refraction, the magnitude of which is connected with the magnitude of the tension and can be measured with an optical apparatus. It is established that the difference of the velocities, and, therefore, the optical difference of the beam's path  $G$ , is proportional to the difference of the main normal tensions ( $\sigma_1 - \sigma_2$ ). The

Card 1/2

S/138/60/000/003/006/007  
A051/A029

The Polarization-Optical Method for Investigating Tensions in Sealing Parts

following formula was derived:  $G = cd (\sigma_1 - \sigma_2)$ , where  $c$  is the optical constant of the material, determined experimentally,  $d$  is the thickness of the model. The authors made a study of the state of stress under different pressures of the medium depending on the design of the sealing and landing space and on the size and strength of the bracelet springs. Models made of optically-active material, i.e., igdantine prepared on a gelatin and glycerol base, were studied. The procedure is explained in detail and diagrammatic sketches of the parts studied are submitted. Figure 4 represents a diagram of the distribution of tangent tensions in the stuffing box at a pressure of 0.5 atm of the medium. Figure 5 shows the tangent tensions distributed in the stuffing box at a medium pressure of 1.5 atm. The experimental results are only preliminary, since it was impossible to produce a force in the models, which would simulate the tension at a significant pressure of the medium (1 atm or more). However, the results show the effectiveness of using the discussed method in designing sealing units. There are 5 diagrams, 1 table and 7 references: 6 Soviet and 1 English.

TITLE:

On the Synthesis of Methylol Croton Amide (O sinteze metilol-krotonamida)

PERIODICAL:

Izvestiya Akademii nauk SSSR. Otdeleniye khimicheskikh nauk,  
1959, Nr 1, pp 91 - 94 (USSR)

ABSTRACT:

There are no data available in publications on the synthesis of methylol croton amide. In the present paper it was obtained by the authors according to the following scheme: crotonic acid → crotonic acid chloride → crotonic acid amide → methylol croton amide. Crotonic acid was synthesized from malonic acid by the interaction with acetaldehyde in pyridine and with ethyl alcohol as a solvent. Crotonyl chloride was obtained by the effect of thionyl chloride on solid crotonic acid. Its yield amounted to 70% instead of 37% as mentioned in publications. There are numerous data on the synthesis of croton amide (Refs 4-9). It was obtained most easily by the effect of crotonyl chloride on liquid ammonia in ether solution at -35°. Methylol croton amide

Card 173

1/2

## On the Synthesis of Methylol Croton Amide

SOV/62-59-1-15/32

was synthesized by the interaction of croton amide with paraform in the presence of sodium ethylate as a catalyst. Table 1 gives some data on some experiments of methylol croton amide synthesis. Methylol croton amide represents needle-shaped crystals which at low temperature are easily dissolved in water, alcohol and dioxane, and on heating in ethyl acetate, vinyl acetate and benzene. It was found that methylol croton amide can form ether on heating without a catalyst. The ether was obtained by heating methylol croton amide in toluene and distilling off the reaction water with the vapors of the solvent in the absence of the catalyst (Table 2). As may be seen from the analysis, the amount of nitrogen in ether approaches the theoretical content, and the melting point increased from 87° for methylol croton amide up to 136° for ether. The ether of methylol croton amide represents needle-shaped lustrous crystals which at low temperature are soluble in acetic acid and on heating in water, dioxane, benzene and xylene. There are 2 tables and 11 references, 1 of which is Soviet.

TITLE:

On the Synthesis of Methylenе Biscrotonamide (O sinteze  
metilen-bis-krotonamida)

PERIODICAL:

Izvestiya Akademii nauk SSSR. Otdeleniye khimicheskikh nauk,  
1959, Nr 5, pp 888-891 (USSR)

ABSTRACT:

There are no references in publications with regard to the synthesis mentioned in the title. These compounds are interesting: they contain nitrogen, two double bonds, and are capable of copolymerization. I. A. Arbuzova carried out tests with acryl derivatives at the authors' institute. In this work, methylene biscrotonamide was synthesized in three different ways: 1) two molecules of methylol crotonamide separate water and formaldehyde, 2) the amide of crotonic acid separates water under the effect of methylol crotonamide, 3) the di-ester of methylol crotonamide separates formaldehyde with thermal treatment. The first reaction took place without catalyst by heating a xylene solution of methylol crotonamide. Table 1 shows data of this synthesis. Nitrogen content, double bonds, melting temperature, molecular weight and solubility of

Card 1/2

On the Synthesis of Methylene Biscrotonamide

SCV/52-59-5-18/40

the compound obtained were determined. (Data on analysis in table 2). The second reaction too, took place in xylene, with heating and without a catalyst. Tables 3 and 4 contain the same determinations of substances synthesized in the second way as table 2. Tables 5 and 6 show the corresponding data of the third way of synthesis. In this case the reaction desired was brought about by heating the di-ester in various aromatic solvents. The bromine number of the methylene biscrotonamide of the last two compounds obtained was close to the theoretically determined value. There are 6 tables.

TITLE: The synthesis of copolymers of vinylpyrrolidone and vinyl alcohol

SOURCE: Vy'sokomolekulyarnye soyedineniya, v. 6, no. 8, 1964, 1440-1441

TOPIC TAGS: copolymer, vinylpyrrolidone copolymer, vinyl alcohol copolymer, polyvinyl, diazoisobutryonitrile, methanolysis

ABSTRACT: Copolymerization of vinylpyrrolidone with vinylacetate (9:1) was carried out in the presence of diazoisobutryonitrile as the initiator to produce a copolymer from which, by subsequent (6, 8 and 10 hrs.) methanolysis with sodium or potassium methylate in absolute methanol at 20C, four new polymers were prepared with yields of 49.9, 49.64, 48.6 and 44.4% of the theoretical. The copolymers, precipitated with ether from the methanol solution in the form of white flakes, were washed on the filter with ether and dried in a vacuum at room temperature. Specifications for the procedure, the structural component pattern and the content of nitrogen, hydroxyl groups and acetate groups in the polymers are tabulated. The viscosity of the polymers was found to increase with the copolymerization duration. Orig. art. has: 1 table.
